## This anti-lift system prevents fences from being lifted out of the footing

### Prevent unwanted gaps in your fence line

This anti-lift device ensures that temporary fences cannot be lifted out of a massive concrete block. The hook slides under the block and is then secured to the fence with a High Security clamp. This creates an additional connection that keeps the fence firmly in place. The system is universally applicable, quick to install, and contributes to a secure and professional site appearance.

- Prevents fences from being lifted out of the block
- Suitable for blocks with or without a dedicated hole
- For temporary and semi-permanent fence setups

### More security with minimal effort

Without an anti-lift device, fences can be tilted out of their block, an easy entry point for intruders. This device effectively eliminates that risk. When used with a High Security clamp, only removable with a special key, unauthorised removal is virtually impossible. By placing the clamp on the inside of the site and using Anti-Climb fences, you maximise perimeter security and make unauthorised access nearly impossible.
